Dear Trail tech Vapor Customer

When fitting a Trail Tech Vapor computer to a Lambretta or Vespa it has come to our attention that the main power feed source on page 11 needs be fitted any way shown below:

1. Direct the 12 Volt battery fitted to the bike
2. Or with an external battery working on dead loss system, MBD do a very small Trail Tech battery pt no:MTT0002 and also do a battery bag to suit pt no: MTT0013
3. Or with a Koso AC-DC charger MBD pt no: SA00010
4. Or with an AC power supply, BUT AC needs to come from before the regulated power supply i.e. from the stator plate wire

If you are having problem with erratic working of the computer using the AC way always try using a small battery strapped to the bike first to eliminate AC power supply problems.

Power supply wires on the computer can be fitted either way they are not polarity conscious! But if you have bought the full kit from us, we pre wire it to make life easier for you.

- a. Two black/red tracer wires have a ring terminal, this is earth
- b. The remaining red wire with bullet is power feed either AC or DC as your system suits.

ALWAYS make sure the computer is rubber mounted and the outside case doesn't vibrate on the frame/headset area.
